"The condensin complex governs chromosome condensation and mitotic running from the complex governs chromosome condensation and mitotic running from transmission of rDNA.";

1. Cell Biol. 149:811-824(2000).

1. Cemponent of the condensin complex is found in the complex is associated with the component of the condensin associated with the chromosome condensin on associated with the chromosome condensin on associated with the chromosome of the condensation. Dissociation from the component of the condensation. Dissociation from the component of the condensation.

DOMAIN: The flexible hinge domain, which separates the large intramolecular coiled coil regions, allows the heterodimerization with SMC2, forming a V-shaped heterodimer (By similarity).

SIMILARITY: Belongs to the SMC family. SMC4 subfamily.

mitochondrial protein precursors (By similarity).

FUNCTION: THIS IS A COMPONENT OF THE UBIQUINOL-CYTOCHROME C REDUCTASE COMPLEX (COMPLEX III OR CYTOCHROME B-C1 COMPLEX), IS PART OF THE MITOCHONDRIAL RESPIRATORY CHAIN.

MEDIATE FORMATION OF THE COMPLEX BETWEEN CYTOCHROMES C AND CATALYTIC ACTIVITY: Release of N-terminal transit peptides f precursor proteins imported into the mitochondrion, typicall Arg in position p2.

CATALYTIC ACTIVITY: QH(2) + 2 ferricytochrome c = Q + 2
                                                                                     FUNCTION: Cleaves presequences (transit peptides)

Midentification of Paramecium mitochondrial proteins using antibodies
raised against fused mitochondrial gene products.";
Gene 49:129-138(1986).

-I- FUNCTION: Cytochrome c oxidase is the component of the respiratory
chain that catalyzes the reduction of oxygen to water. Subunits 1-
3 form the functional core of the enzyme complex. Subunit 2
transfers the electrons from cytochrome c via its binuclear copper
A center to the bimetallic center of the catalytic subunit 1.

-I- CATALYTIC ACTIVITY: 4 ferrocytochrome c + O(2) = 4 ferricytochrome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           01-AUG-1988 (Rel.

(first entry)

House dust mite allergen protein (map) A/B N-terminal fragment

AAY52510 standard; peptide; 14 AA.

Mite allergen protein; map; high molecular weight; HMW-map; allergy; house dust mite; IgE; immunoglobulin E; allergen; mapA; mapB; hypersensitivity reaction; therapy; treatment; diagnosis; human; feline; canine; veterinary; antibody; vaccine; immunisation. 02-SEP-1998; 17-APR-1998; 13-MAY-1998; 16-APR-1999; 28-OCT-1999. Dermatophagoides farinae. Mccall CA, WO9954349-A2 (HESK-) HESKA CORP. Hunter SW, 98US-00062013. 98US-0085295P. 98US-0098909P. 99WO-US008524. Weber

Novel high molecular weight Dermatophagoides nucleic acid polypeptides used to modify an animals' hypersensitivy to mite allergens.

Claim 3; Page 69; 154pp; English.

WPI; 2000-052700/04.

Sequences AAY52510-Y52522 represent proteolytic fragments of Dermatophagoides farinae high molecular weight mite allergen protein (HWM nempt) composition. The HMW-map composition was isolated from a D. farinae homogenate by gel filtration, with each fraction being analysed for the presence of proteins that bound to IgE present in mite-allergic dog antisera. The HMW-map composition comprises mapA (a 109 kD protein) and mapB (98 kD). Mite allergenic proteins and peptides, and nucleic acids encoding them, may be used in therapeutic compositions to modify an animal's hypersensitivity reaction to mite allergens. Animals that may be treated include mammals and birds, especially felines, canines, equines,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       humans, other pets, and work or domestic animals. The proteins or fragments may also be used to diagnose allergies via a skin test. The proteins and peptides can also be used to raise antibodies, which have a variety of potential uses. For example, they can be used as vaccines to passively immunise animals against dust mite hypersensitivity, as positive controls in test kits and as tools to recover desired dust mite allergens from a mixture of proteins
                                                                             Dermatophagoides, designated Der HMW-map protein, and its related nucleic acid. The Der HMW-map protein is useful for eliciting an immune response against Der HMW-map protein. The protein or a reagent comprising a non-proteinaceous epitope is useful for identifying an animal (e.g., dog, cat) susceptible to or having an allergic response to a mite. A therapeutic composition is useful for desensitising a host animal to an allergic response to a mite. The DNA and protein can be used in the allergic response to a mite animal animal fluids, and inhibition of immunoglobulin (Ig)E or Der HMW-map protein activity associated with a disease. Antibodies that bind to Der HMW-map are useful for inhibiting binding of proteins to IgE, to prevent immunocomplex formation, thus
